

# Collaborative Filtering for Movie Recommendation

Comparing Classical and Neural Algorithms

*Aditya Srivastava*

*Harsh Gupta*

*Akimun Jannat Alvina*

*Niharika Narasimhiah Govinda*

**Given a large number of movies, how do  
you make individually targeted  
recommendations for users to watch?**

# Motivation

- Reduce decision making complexity with increasing options
- Drive user engagement and improve customer satisfaction
- Provide an edge over competitors

# Movielens-100k Dataset

- Some numbers;
  - 100,000 movie ratings
  - 943 unique users
  - 1682 unique movies
- User demographics: age, location, occupation etc.
- Movie features: name, release date, genre etc.
- Extensively peer-reviewed
- Popular recommendation benchmark

100000 rows × 18 columns

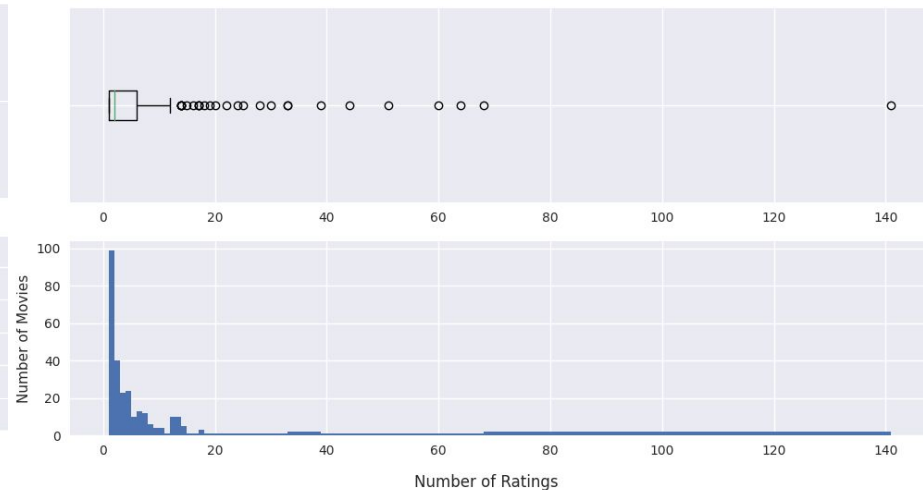

# Data Preprocessing

- Converted explicit ratings (1 to 5) to implicit (1 if rated, 0 if unrated)
- Min-Max scaled numerical features to [0, 1]
- One-Hot encoded categorical features
- Three types of model inputs generated
  - i. Training:
    - *(user\_id, item\_id, rating)*
    - *(user\_id, pos\_item\_id, neg\_item\_id)*
  - ii. Testing/Evaluation:
    - *(user\_id, pos\_item\_id, [neg\_item\_id<sub>1</sub>, neg\_item\_id<sub>2</sub>, ... neg\_item\_id<sub>99</sub>])*
- Negative features sampled randomly

# Data Analyses

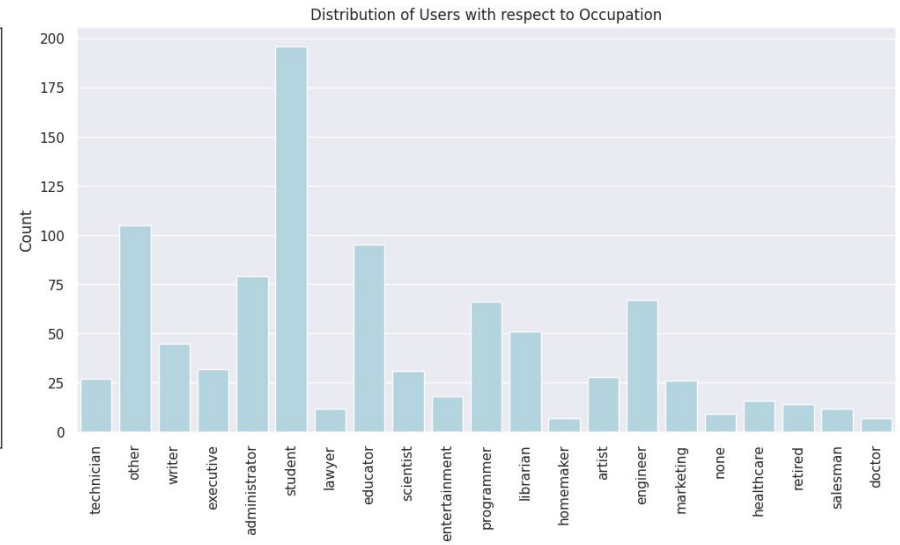

- Majority of users rate only a few movies
- Indicates a significant subset of highly active users
- Two distinct groups: casual raters and avid movie watchers
- Avid users contribute extensive ratings for hundreds of films.

- Prevalence of movies with low ratings.
- Dataset may feature numerous niche films.
- Users tend to rate movies they are familiar with, overlooking lesser-known films.

- Drama emerges as the most popular genre.
- Followed by Comedy and Action in terms of frequency.

- Students exhibit the highest inclination for rating movies.
- Students consume more media, potentially leading to increased movie ratings.
- Homemakers and doctors are less common in the dataset, as highlighted by the figure.

## Correlation study analysis:

- **Genre and Gender Correlation**

- *Women show a preference for Romance movies, while men lean towards Sci-Fi.*

- **Inter-Genre Relationships**

- *Certain genres frequently co-occur, e.g., Animation with Children's and Musical, and Mystery with Thriller*

- **Gender and Occupation Bias**

- *Strong correlations suggest potential biases, with male users associated more with technical professions and female users linked to healthcare and homemaking occupations*

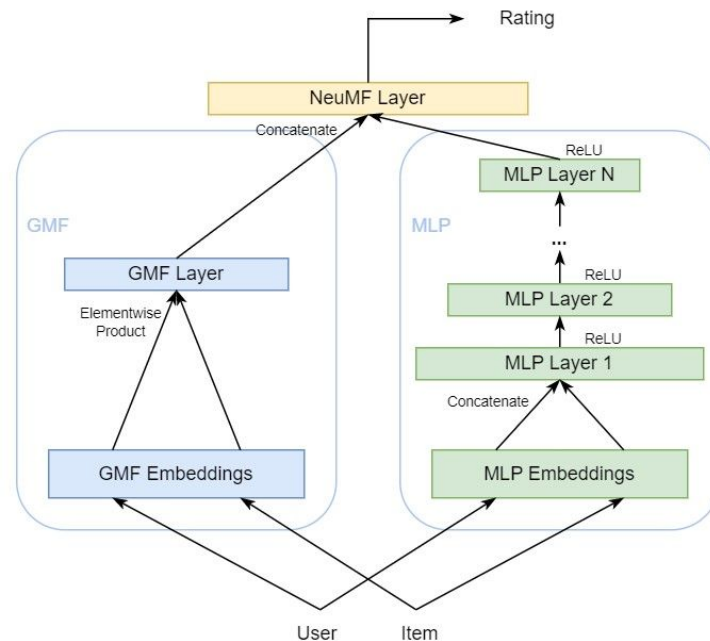

# Method

# Models

**Matrix Factorization (MF)**

**Neural Collaborative Filtering (NCF)**

# Objective Functions

- Three different loss functions:
  - 1. Root Mean Squared Error (RMSE)**
    - *Minimize difference between predicted rating and actual rating*
  - 2. Binary Cross-Entropy (BCE)**
    - *Minimize entropy of predicted distribution vs. actual distribution*
  - 3. Bayesian Personalized Ranking (BPR)**
    - *Maximize the difference in predicted ratings of positive items and negative items*

# Evaluation Metrics

- Two different evaluation metrics:

## 1. Hit Ratio (HR@K)

- *Probability that a positive item's predicted rating falls within the top  $K$  ratings in a set where every other item is negative*

## 2. Normalized Discounted Cumulative Gain (NDCG@K)

- *Same as HR however, there is higher penalization for ranking lower among the top  $K$  ratings*

# Experimental Setting

- Experiments with combinations of models and objectives
- Model hyperparameters were adopted as given in source material
- Optimizers used:
  - Stochastic Gradient Descent (SGD) for RMSE and BPR
  - Adam for BCE
- Optimizer hyperparameters were grid searched
- NCF's GMF and MLP submodules were pretrained before NCF finetuning

# Results

	HR			NDCG		
	@1	@5	@10	@1	@5	@10
MF-RMSE	0.31	0.65	0.80	0.31	0.49	0.54
NCF-BCE	0.23	0.62	0.77	0.30	0.47	0.52
MF-BPR	0.34	<b>0.73</b>	<b>0.87</b>	0.34	<b>0.55</b>	<b>0.59</b>
NCF-BPR	<b>0.38</b>	0.38	0.38	<b>0.38</b>	0.38	0.38

# Results

## Comparing loss functions:

- RMSE and BCE models shows similar performance levels.
- Both RMSE and BCE models are outperformed by BPR.

## Comparing models:

- Classical MF yields better results than NCF for almost every metric and with every loss function.
- NCF-BPR may have better precision.

**Overall best: Matrix factorization model with BPR loss**

# Conclusions

- Surprisingly, classical algorithm > neural counterpart
- Choice of loss function plays a crucial role in model effectiveness
- Indicative of traditional ML techniques still being relevant and competitive
- Factors that may have influenced performance
  - Dataset size disparity
  - Skipped content-based features
  - Model complexity and optimization
    - ***Neural models are more sensitive to tuning on smaller datasets***

# Challenges

- Dealing with data bias
- Complex data preprocessing
- Cold-start problem
- Discrepancies between reference papers
- Missing reference details in reference papers
- Lack of reference code

# Future Work

- **Dataset expansion:**
  - *Test models on the MovieLens 1M dataset for broader evaluation*
- **Comprehensive grid search:**
  - *Extend grid search to optimize model parameters, not just optimizers*
- **Content-based feature integration:**
  - *Explore leveraging content-based features in the dataset*
- **Hybrid model exploration:**
  - *Investigate content-based and hybrid models for more comprehensive analyses*

**Thank you!**
